GitHub Commit and DVC Setup

Here is the **exact flow your collaborators should follow**, step-by-step, no extras.

👨‍💻 1. Get the project (first time only)

Clone the repo

```bash
git clone https://github.com/sandipan-ds/ai_grievance_system.git
cd ai_grievance_system
```

🌿 2. Get your working branch (your feature branch)

See available branches

```bash
git branch -a
```

Switch to your branch (example: `feature/sand`)

```bash
git checkout -b feature/sand origin/feature/sand
```

👉 Now they have **exact same files as your branch**

🌱 3. Create their own branch (recommended)

```bash
git checkout -b feature/<their-name>
```

Example:

```bash
```

```
git checkout -b feature/rahul
```

🖍️ 4. Make changes locally

Edit files normally.

💾 5. Stage + commit changes

Bash

```
git add .
git commit -m "Describe your changes"
```

⬆️ 6. Push their branch to GitHub

Bash

```
git push -u origin feature/<their-name>
```

🔁 7. Create Pull Request (PR)

On GitHub:

- Go to repo
- Click **Compare & Pull Request**
- Select:
  - base → `feature/sand` (or main, depending on flow)
  - compare → their branch

🔄 8. If your branch gets updated (important)

Before continuing work:

Bash

```
git checkout feature/sand
git pull origin feature/sand
```

Then update their branch:

```bash
git checkout feature/<their-name>
git merge feature/sand
```

🧠 Simple mental flow

1. Clone repo
2. Checkout base branch (`feature/sand`)
3. Create own branch
4. Work → commit → push
5. Open PR

⚠️ Rules (important)

- Never work directly on `main`
- Never push directly to `feature/sand`
- Always create your own branch
- Always use PR for review

If you want, I can also give a **clean branching strategy (like industry standard Git flow)** tailored for your project.
